

The Sale:

Pre-Sale:

- Pareto Rule - 20% of salespeople make 80% of the money. **Aim to be at the top!**
 - Set daily , weekly , monthly and annual goals
 - Prepare yourself mentally. Know what to do, how to do it, and practice nonstop.
- Always strive to be better.

- Sell to the subconscious mind of the customer. Become an expert in the psychology of sales.

- Use price conditioning and conditioning in general, tell stories to make you point across, plant seeds.

- Always give 100% effort and understand it's a numbers game. If you do that, you'll be successful.

• Do:

- Take control.
- Turn "want" into "need".
- Turn "pain" into "pleasure."
- Create urgency.

• Don't:

- Pre-judge.
- Be lazy.
- Shortcut.

• Order of selling:

- Sell yourself.
- Sell the product.
- Sell the financing.

- Brian Tracy - 10 keys to personal power

General lead structure

1. Breaking the ice/Creating trust/Asking questions/P.S (Plant seeds)/P.C (Price condition) collect as much information as you can (20 min)
2. **Benefit (program)**: explain the benefit, then get a “yes” (20 min)
3. **Product**: present the product, then get a “yes” (20 min)
4. **Company**: present the company, then get a “yes” (20 min)
5. Get 3 “yes” again (benefit , product , company)
6. **Present the price (you dont present the price if you dont feel the client is ready)**
 - price comes only after 75 minutes (1 h and 15 min)

6. Closing

7. **cool down (10-15 min)**

1. Breaking the ice + control :

The goal is to find common ground and CREATE TRUST. Time will help you penetrate their sub . for control - give me cup of water , place to sit and electric bill.

The best way to break the ice in a home meeting is to start with something personal you can genuinely connect over. Look for clues in their space — a family photo, a piano, a guitar, a surfboard in the garage — and start a friendly conversation about it. This builds trust and makes the homeowner feel comfortable before you get into the presentation."

1. Break the Ice (2–3 minutes)

- As soon as you enter, look for something personal to connect over:
Family photos, a piano, a guitar, sports gear, a surfboard in the garage, garden features, etc.
- Start with a friendly comment or question:
 - “Wow, you play guitar? How long have you been playing?”
 - “These are beautiful family photos — when was this taken?”

- Keep it light and genuine — the goal is to make them feel comfortable.

once you find a conversation - start the connection part for a 10-15 minutes

conscious mind and turn the sale into an emotional and impulsive decision.

Remember:

- **Ask, don't tell.** The best salespeople lead with questions, not lectures.
- **Stack “Yes” answers.** Throughout the meeting, get them agreeing often — it builds momentum toward the close.
- **P.S. (Plant Seeds).** Drop hints early that set you up for a future discount, deal, or special offer.
- **P.C. (Price Condition).** Establish a high price expectation early, so your final offer feels like a win.
- **Listen > Talk.** Let the customer do most of the talking — you'll learn their priorities, hesitations, and motivations.
- **Identify pain points.** Find out what they want, what they need, and what's frustrating them right now.
- **Own the room.** Keep their focus on you — you are the guide, the expert, and the problem-solver.

2. Shift Into Discovery Mode (7-12 minutes)

- **Ask, don't tell.**
 - “What made you interested in this program?”
 - “how did you heard about us “ ?

- “What’s been your biggest frustration with your current [energy costs/home setup]?”
- why do you want to replace your roof/windows/Hvac ?
- **Listen more than you talk.** Let them share their story.
- Collect **as many “yes” answers** as possible early on.
- Identify **pain points** — what’s bothering them now and what they’d love to change.
- Drop **P.S. (Plant Seeds)** for later:
 - “I’m going to show you some ways people in your area have saved thousands...”
- Set **P.C. (Price Condition)** by subtly hinting at a high starting cost:
 - “Programs like this can run well into the tens of thousands, but the state incentives are making a huge difference right now.”

Slice	Description	Suggested Weight (%)
Knowledge	Deep understanding of the product, incentives customer needs, and regulations	30–40%
Sales Tactics	Questioning techniques, objection handling, emotional triggers, closing strategies	25–35%
Time	Efficient use of selling time—discovery, presentation, follow-up	15–25%
Control	Leading the conversation, steering urgency, managing decisions	10–20%

Pain discovery questions :

1. Start with Context & Rapport

(Soft openers — makes them talk about themselves while giving you key info)

- “How long have you been living in the house?”
 - “What do you love most about it?” *(opens them up positively before discussing problems)*
-

2. Understand the Motivation

(Find the emotional driver)

- “What made you start thinking about doing this project?”
 - “How long have you been thinking about it?”
 - “If you could wave a magic wand and fix one thing about your home, what would it be?” *(emotional hook)*
-

3. Identify Prior Attempts & Roadblocks

(Reveals objections you’ll need to overcome later)

- “Have you talked to any contractors or gotten any bids yet?”
 - *(If yes)* “What stopped you from moving forward with them?”
 - *(If no)* “What’s been holding you back from getting started?”
-

4. Establish Financial Readiness

(Without scaring them off — plants seed for affordability)

- “Have you applied for financing for this project before?”
 - “have you applied to any program in the past ? “
 - “Do you know anyone who’s taken advantage of the [state program/etc.] — maybe family, friends, or neighbors?”
-

Pain Discovery – Product-Specific Deep Dive

1. Roof

- “How old is your roof?”
 - “Have you noticed any small leaks, dark stains, or missing shingles?”
 - “When it rains, do you ever worry about potential water damage inside?”
 - “Do you know the life expectancy of your current roof material, and how close you are to it?”
 - “Has anyone inspected it recently for hidden damage or heat loss?” (*sets up inspection urgency*)
-

2. Windows

- “When were your windows last replaced?”
 - “Are they single-pane or double-pane?”
 - “Do you ever feel drafts coming in, even when the windows are closed?”
 - “In summer or winter, do you feel the temperature change when you stand near them?”
 - “Have you noticed condensation or fogging between the panes?” (*signals seal failure*)
 - “Have you feel loud noise from the street ? “
-

3. Exterior Paint

- “When was the last time you painted the exterior of your home?”
- “Do you see any peeling, cracking, or fading on the sunny side of the house?”
- “Has the paint started to lose its color or look dull compared to when you moved in?”
- “What color will you paint the house ? same color or you want a new look ?”

4. HVAC

- “How old is your heating and cooling system?”
- “Do certain rooms in your house feel hotter or colder than others?”
- “Have you noticed the system running more often lately to keep the same temperature?”
- “What’s the highest repair bill you’ve had for it?”
- “Have your energy bills been creeping up over the last few summers or winters?”

5. Turf / Water Bills

- “How much are you spending on your water bill each month in summer?”
- “Do you have sprinklers running daily for the lawn?”
- “Have you noticed bare patches or areas that always seem thirsty no matter how much you water?”
- “Have the water restrictions in your area affected how your yard looks?”
- “If you could have a yard that looked perfect year-round without a water bill spike, would that be worth it to you?”

Walking In With Two Hats – The Ultimate Positioning

When you walk into a customer's home, you are **two professionals in one**:

1 The Contractor Hat – The Project Expert

Your role here is to **remove every ounce of work and stress from the homeowner**:

- You bring **experience, knowledge, and connections** to get the job done right the first time.
- You are a **one-stop shop guy** — no chasing multiple companies, no confusion.
- **No down payment** — they only pay as the project progresses.
- You handle **everything A to Z**:
 - Hiring and managing subcontractors/workers
 - Pulling permits
 - Passing inspections
 - Solving unforeseen problems quickly
 - Securing financing approval
 - Handling insurance requirements
- The homeowner **does nothing** — except enjoy the results.

Positioning line: *“That’s why my customers hire me — so they don’t have to lift a finger.”*

2 The Financial Advisor Hat – The Investment Strategist

Your second role is to **make the project make financial sense** — so it feels less like an expense and more like an asset:

- Show how the home's **value increases** after improvements.
- Explain that upgraded homes **sell 20% faster** and for a **higher price** than similar ones.
- Emphasize **equity growth** — these upgrades can give them equity they can tap into when needed.

- **Present the numbers clearly** — show ROI, payback period, and real-world examples.
-

Special Focus for Retired or Fixed-Income Homeowners (65–70+)

- Their income is fixed and **not growing**.
- Their expenses — water, electricity, gas, food, clothing, insurance, medical — **are always rising**.
- Energy-efficient upgrades **fight back** against rising costs by **locking in utility savings**.
- The **only expense** that can turn into an investment is **utilities** — because rates always go up.
- The best time to take care for the house is now - no when they will be older
- **Offer a fixed monthly payment** to replace unpredictable bills — no more rate hikes, no more surprises.

Positioning line: *“Why keep renting your power from the utility company when you can own your savings?”*

Close the Section With a Strong Comparison:

“Right now, you’re paying utilities that go up every year. Instead, you could have a fixed payment that’s often less than what you already pay — and in the process, increase your home’s value, improve comfort, and protect yourself from future rate hikes.”

The program

The "Program" story is just a way to connect between what the telemarketer tells the customer and what the customer expects to hear from you.

It doesn't mean that you need to sell the program!

SB 350 is a government approved program that focuses on reducing our dependency on fossil fuel and promotes usage of renewable energy resources and decrease in electric usage in the state of CA. The state regulates, approves, and allows financial institutes to offer funding and affordable financial options of home improvement projects under Title 24, for green and energy efficient products only. Homeowners can take advantage of available programs upon qualification.

The reason why you're at the house is first and foremost because the customer needs a project done, and not because someone called them.

Work that angle and the fact the customer is looking for a project. Start creating urgency with the program:

- The state has limited funds, on a first come first served basis. TAKE THE MONEY!!!!
- The program moves from zip code to zip code to allow ALL people in CA to get those incentives.
- The more projects and savings you'll have, the higher chances you'll qualify and receive a rebate.
- The program works together with utility companies. If your electric bill is high/low, it may lower your chances to get accepted and receive rebates and incentives.
- Separate yourself from the program. We are not the one calling, it's a telemarketing service.

Step 1 – Open & Disarm

“I want to explain the energy efficiency program. Did anyone tell you about it on the phone?”

(They’ll probably say no.)

“No problem — that’s why I’m here. Sound good?” **(yes #1)**

Step 2 – Curiosity Question

“Have you heard of something called SB 350?”

(They’ll probably say no.)

“Perfect — I’ll be the first to show you.” **(yes #2)**

Step 3 – Show Proof

- Open the iPad to the official **SB 350** government page.

“This is the state’s website. You can see here — California wants to increase clean energy from 33% to 50% by 2030.

Makes sense they want more clean energy, right?” **(yes #3)**

Step 4 – New Homes vs. Old Homes

“With new houses, it’s easy because they have to follow Title 24 code to pass inspection — so they already have energy windows, solar panels, cool roofs, all that.

Older houses are different. No one can *make* you upgrade. That’s where this program comes in.

You see how it’s harder for the state to make older homes more efficient?” **(yes #4)**

Step 5 – How the Program Helps

“So because they can't force you, the state gives rebates and incentives for projects like windows, solar, roofing, HVAC — to make your home more efficient.

You save money, the state reaches its energy goal, and your home is more comfortable.

Sounds good, right?” **(yes #5)**

Step 6 – Urgency

now you drawing 6 circles with numbers and explaining how the program separate the money by cities because they need to make it equal for all california : 1,2,3,4,5,6

Let me show you how the state separates the rebate money so it's fair for all of California — think of it like six different cities, each with its own budget for different types of projects like windows, solar, roofing, HVAC, turf, or paint. For example, here in [client's city] there's about \$200,000 this month just for [client's product], but in a nearby city it might be \$150,000 for solar, another might have \$100,000 for HVAC, or \$250,000 for roofing. The amounts are different in each area, and once the money for a ZIP code is gone, we have to wait around 10 months for the next round — and it's not always the same amount.

some of them even get approved to the “ no money out of pocket “ option , but i will see later (to make them want it)

That's why it's important to check now while it's still available. You see what I mean?” (yes #6)

“Let me tell you why this program is different now — and why timing matters.

Just a couple of years ago, the program worked in a completely different way. Back then, homeowners would apply, find out how much they qualified for, and then get that money *later* as a check — usually 60 to 120 days after the project. For example, if your project cost \$50,000 and you qualified for \$10,000 in rebates, you still had to pay the full \$50,000 up front and then wait for that \$10,000 check to come back.

Sounds fine in theory, but here's what really happened — people didn't get their checks on time, homeowners moved and changed addresses, budgets ran out before the check was sent... it turned into a mess. A lot of people simply never got what they were promised.

So the state made a big change. Now, instead of waiting for a check, every private contractor has a rebate department that handles everything for you. We do the application, see exactly what you qualify for, and whatever rebate you get is deducted from your total price the same day. That amount comes directly out of your ZIP code's budget, instantly.

The good news is — you don't have to wait for checks, you don't have to wonder if you'll get approved, and you don't have to worry if the money will still be there later. The moment we lock it in, it's yours. The only catch is... once your ZIP code's budget is gone, it's gone until the next cycle — and there's no guarantee it'll be the same amount.”

so if your project cost 50K and you was qualified for 10k - you pay only 40k .

now the main benefits for all of that program is 3 things :

1. rebates - which you can call it as a “discount “ , that people getting can get between 7-18% (but the average is 10-14 %)

2. “Now, let's talk about one of the hardest programs to get approved for — No Money Out of Pocket. Only about five people a month in this area qualify. What it means is simple — you don't pay a single dollar until the project is completely done. That puts you in a zero risk position.

Let's take a kitchen as an example. Normally, do you know how payments work in construction? You pay in stages:

- Down payment – usually about 33% up front.
- lets take your kitchen as an example - do you know how much cost kitchen ?

- If your kitchen is \$40,000, that's around \$13,000 right away.
- Middle of the project – another 33%, another \$13,000.
- End of the project – the final 33%, another \$13,000.

That's how it usually works.

But with us — if you qualify for NMOOP — we start your project, order the materials, bring in the labor, and finish everything... and you start to pay 30 to 90 days after the project is done only a monthly payment .

Sounds like a dream, right?" (yes #8)

Electric bill rate hikes

All products we sell are energy efficient. Put a focus on explaining the connection to electric rate hikes and as a result, savings over time. This is a selling point!

PREVIEW QUESTIONS:

1. Do you know how much utility companies increase their rates every year?
2. Do you know why?

Reasons for rate hikes:

1. Renewable energy executive order from November 2008 (SB 350), requires 33% energy production from solar. That goal has increased to 50% by 2030 by the state of CA.
2. Brightsource and building solar farms Utility companies deliver the cost to the consumers.
3. Solar for non-users: Utilities want to maintain their revenue. Those who don't go solar will get charged more.
4. Supply and demand: As a society, we're using more electricity than 10, 20 years ago. With Fossil fuels being diminished, cost of oil, coal and gas will rise. More demand with less supply drives prices up. This is the first rule of economics.
5. Maintenance and Infrastructure. Old power plants, old electricity poles need rebuilding. All that costs a fortune to fix and maintain.

6. Cost of living in CA is among the highest in the country. Annual Inflation in the US is approx. 2-2.5% per year. in the last 30 years,

- **Show articles and websites that support your claim. If the customer sees and reads it, he will believe you.**

- **Make sure to ask the customer closed ended questions with a YES answer, so the customer sells himself and understands why rates are increasing.**

- **Mention high numbers that relate to rate hikes - 13%, 17%, 11%, 14%, then explain why an 8% annual increase is a very conservative assumption.**

Do you see how prices go up? YES

Do you understand why? YES

now you moving to talk about the product

Product:

Cool Roof:

- Benefits:

- Cooling the house environment
- Saves energy – saves 15-20% on the utility price - Complies with title 24.
- Life protection against leaks.
- Carries lifetime warranty. (which is 25 years)
- Increases the equity by 68% of the roof investment amount.
- use the youtube video to show the client/ roofing metal pack

- Roof Sizing:

1. Go to “zillow”
2. Insert the home address and find out the square fit of the house (example 2000 sqf)
3. If there’s a **detached** garage, add approx. 400 sq. (decide if it’s part of the new roof.) -if its attached to the house, add approx. 400-500 sq. (garage is not livingspace)
4. Add additional 50% for the roof size (because of the slope and overhangs)
5. Each 100 sq. equals 1 big sq. In our example: 2000 sq. house = 20 big sq
2000 + 1000 (50%) 3000 sq. of roof space. That equals 30 big sq.

- Roof Pricing

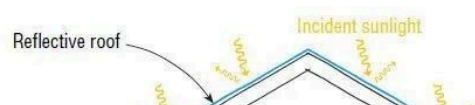

- Overlay – adding an additional layer of shingles. NOTE: building code allows a max of 2 layers. Cost is \$400/big sq
- Tear off – removing the existing layers of shingles and tar paper, revealing the plywood, and installing a new one. Cost is \$480/big sf. Each layer of existing shingles adds additional \$20/big sq. We will inspect the wood sheeting and replace it with up to 10%. Any additional plywood replacement will require an extra charge.
- Re-deck – removing the entire layers of shingles, and plywood, and installing new one. Cost is \$650/big sq
- allways take the higher to be ready for surprised prices

Many changes may occur due to wood shakes / High pitch / No access ETC.

It is highly recommended to consult with your roofer before closing a job.

- use the roof drawing with the comparison between the asphalt road to the asphalt shingles - next page

Roof pitch :

(Take a piece of paper and draw a simple house with a roof.)

“Let me ask you — do you know what asphalt shingles are made of?”

(Wait for them to answer — if they say asphalt, nod and smile.)

“Exactly — asphalt. Now, think about the asphalt on the road. If you walked barefoot on it in the middle of summer, what would happen?”

(Pause — let them say “burn your feet.”)

“Right — you’d get burned. And that’s exactly what happens to your roof in the sun. The sunlight heats up the shingles, that heat goes into your attic, and then the hot air moves from your attic into the vents... making your whole house hotter.”

“A **cool roof** works differently. Instead of absorbing the heat, it **reflects the sun’s rays** away from the roof. That keeps your attic cooler, which keeps your house cooler, which means your AC doesn’t have to work as hard. And when your AC runs less, your electricity bill drops.”

“So it’s not just a roof — it’s like putting sunglasses on your house.”

Vinyl energy efficient double pane Windows:

- Benefit:

- Saves on energy, approx. 15-25% of the electric bill.
- Complies with Title 24.
- Cleaner and looks better in comparison to aluminum or old wooden windows.
- Noise reduction.
- Argon gas in between the 2 layers of glass.
- Safety feature.
- Dust reduction.
- Carries lifetime warranty.
- Increases the equity by 68% of the roof investment amount.

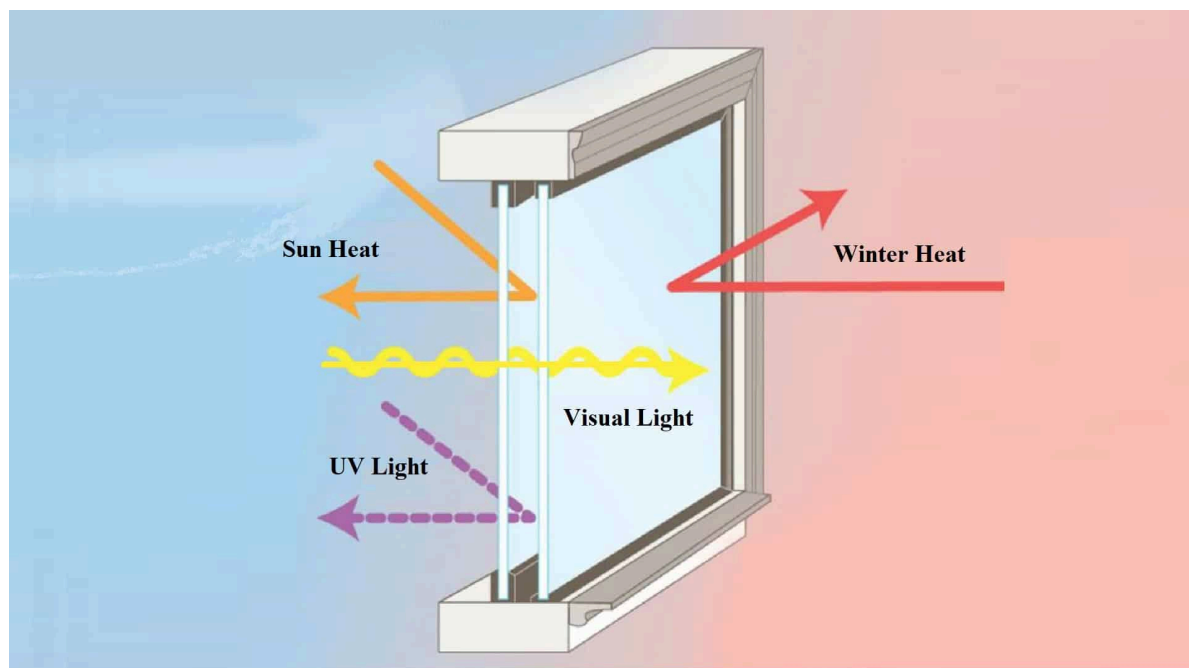

*Need an addendum – “Windows permit will be pulled and finalized by the homeowner.”

This is a general price list. Use your judgment based on the prices below and based on actual size

and product.

- Small – 2x3 ft. - \$400 - \$450
- Medium – 3x4 ft. - \$500 - \$550
- Large – 5x6 - \$600 - \$650
- Sliding door - \$2,500 - \$3000
- For arched windows ask your dealer

- Product:
- colors for vinyl : white , cream , brown
- black is double price
- wood is not recommended (take too much time and very expensive)
- usually windows can be installed by 7-12 days after the measurements
- always try to sell another product with windows to open the job quicker (tankless , insulation , recessed lights and etc)
- carry with you sample of window for better Demo

(Take a piece of paper and draw a simple house with 3–4 windows.)

“Let me ask you — do you know what happens when you have older single-pane windows in summer or winter?”

(Pause for their guess.)

“Exactly — the heat and cold go right through the glass. In summer, the sun heats the glass, and that heat moves straight into the house. In winter, the warm air inside escapes, and the cold air outside sneaks in.”

(Draw arrows going from outside through the window into the house.)

“Think about standing next to a window on a hot day — can you feel the heat? Or on a cold day — can you feel the chill?”

(Wait for them to say yes.)

“That’s your energy and money slipping right through the glass.”

“Now, **energy-efficient windows** work differently. They’re double- or triple-pane, with special coatings that reflect the heat back out in summer and keep the warmth inside in winter.”

(Draw the same house, but now with arrows bouncing back off the window.)

“That means your home stays comfortable all year, your AC and heater don’t have to work as hard, and your energy bills drop. Plus, you block out a lot more outside noise — it’s quieter inside.”

“So it’s not just a window — it’s like putting invisible insulation and sunglasses on your glass.”

Cool Life Exterior paint:

Benefits:

- With Cool Life Heat Reflective Coating you will never have to paint your home again. It also saves you money on home energy costs.
- The heat reflective coating is much thicker than paint, and more durable.
- Additionally, it is waterproof and breathable.
- Cool Life uses a patented technology developed specifically for reflecting the sun's natural heat waves.
- Low VOC - Volatile Organic Compound. Much better for the environment and a lot less toxic.
 - Lasts longer.
 - base on rubber
 - Cool life has a much thicker consistency. Can't spill. Made of Acrylic Resin.
 - waterproof product.
 - Saves 5-21% on energy in the house.
 - Cool life gives the homeowner a lifetime warranty! with certificate that mailed to his address .
 - Chemically bound. Acrylic resin based.
 - Only sell to licensed approved and qualified contractors. You can't just walk in and buy it at Home Depot.
 - the team has to be trained 6 weeks in order to start use the material
 - Will cool the house 5-8 deg. Will save approx. 15% of energy bill!
 - Normally the bottom of the wall is where the majority of damage is done, because of moisture.
 - Trench the house 4-6 inch to avoid damage caused by moisture (not in areas where there's cement)

• The Process:

1. power wash the house with high PSI
2. Trenching
3. Stucco repairing cracks & patching + calking
 - Repair/replace all rotten/damaged wood.
 - Wood sanding. than :
 - 1 coat of primer.
 - 2 coats of paint.(after color selection)

- Energy savings:

for a house with \$500 a month electric bill, savings of 15% will be \$75 a month.

Over a year = \$900.

Over 25 years with zero rate hikes = $25 \times 900 = \$22,500$. Over 25 years with rate hikes = \$22,500!!!

Do it today for 25k. And save energy of 22,500 in the next 25 years.

Total investment of \$2,500.

Pricing:

a house of 1800 sq. including an attached garage, will cost approx. \$8,000.

A 2-story house of 3000 sqf would cost approx. \$10,000.

The pitch :

“Let me tell you where this technology actually comes from — the military.

Back in the day, when tanks trained out in the desert, there was no AC inside. The soldiers were sitting in metal tanks under the sun, and it would get extremely hot — so hot it was hard to breathe. And when the tanks came back from a mission, they were so hot that they had to sit and cool down for almost **four days** before they could even power wash them.

Then the military developed a special **cool coat paint**. This coating went on the outside of the tanks, and it reflected the sun’s heat instead of absorbing it. After that, the soldiers could stay inside much longer without overheating, and when the tanks came back from a mission, they could power wash them the **same day**.

That same technology is now used for **homes**. When we apply cool exterior paint to your house, it works just like it did on the tanks — it reflects the sun’s heat, keeps the walls cooler, reduces the heat inside your home, and helps your AC run less. Plus, it lasts much longer than regular paint.”

You can also ask them - when was the last time you painted the house ? How much do you remember?

“Quick question — do you know how much it costs to paint a house these days?”

(Pause and wait for their answer — this lets you gauge their knowledge.)

“Right now, regular exterior paint jobs run about \$10,000 to \$12,000. And the thing is, with regular paint, you have to redo it every 7–8 years. So in 25 years, you’ll probably paint your house three times.

And here’s the kicker — if it’s \$12,000 now, in 7–8 years it’ll likely be around \$15,000, then \$17,000 after that. That’s a total of about \$35,000 over the years... just to keep your house painted.

With our cool exterior paint, you pay \$25,000 once, and you’re done — it’s built to last decades without needing to be redone.

And if you’re wondering, ‘What if I want to change the color later?’ — great question. Since you’d already have the primer, the base, and the insulation coat in place, a new color change would cost you only about \$1,200. That’s it.”

Dry Landscape: turf , pavers , DG

- Focus on:

1. Overall savings of water and gardener, and other miscellaneous expenses related to maintaining the yard (flowers, new hose, soil, dripping system, etc.).
2. The visual change that will happen when the yard looks better/greener/more organized, etc.
3. SHOW PICTURES OF OTHER PROJECTS!

- Take control! Try to walkthrough with them, visualize what they are willing to achieve and make them active in the process.

In addition, the state of CA has declared drought and many cities have restrictions on how often homeowners are allowed to water their lawn, with restrictions on maximum of 6-8 minutes per day, only twice a week. Because of the drought, water prices are on the rise which drives up the total cost of maintaining grass, especially over the next 20 years. LADWP have increased their water prices by 11-13% in 2023 and 2024.

- Talk to the customer about the total savings:

	Gardener	Water	Miscellaneous	Total monthly	Total annually
Today	120\$	100\$	10\$	230\$	12X230= 2760\$
in 5 years	180\$	150\$	15\$	345\$	12X345= 4140\$
in 10 years	240\$	200\$	20\$	460\$	12X460= 5520\$
in 20 years	400\$	400\$	50\$	850\$	12X850= 10,200\$
in 20 years with inflation					110,000\$

Re - do your yard and it'll save you 50 - 70 % of that total expense!!!

Pricing:

- Turf - \$6-7 per sq.
- Gravel / DG (Decomposed granite) - \$4-5 per sq.
- Dripping system - \$650- 1,000 (depends on scope of work)
- Tree removal - \$500-\$2,000 (depends on scope of work)

HVAC

Each 400 sq ft needs 1 TON unit.

A 2000 sqf house will need 5 Ton unit.

If the house is 2800 sqf, then you need to sell 7 Tons (3+4-ton units)

SEER- The efficiency of air conditioners is often rated by the Seasonal Energy Efficiency Ratio (SEER)

Air-conditioner sizes are often given as "tons" of cooling, where 1 ton of cooling equals 12,000 BTU/h (3.5 kW). 1 ton of cooling equals the amount of power that needs to be applied continuously over a 24-hour period to melt 1 ton of ice.

The annual cost of electric energy consumed by an air conditioner may be calculated as follows:

$$(\text{Cost, \$/year}) = (\text{unit size, BTU/h}) \times (\text{hours per year, h}) \times (\text{energy cost, \$/kW-h}) \div$$
$$(\text{SEER, BTU/W-h}) \div (1000, \text{W/kW})$$

Example 1:

An air-conditioning unit rated at 72,000 BTU/h (21 kW) (6 tons), with a SEER rating of 10, operates 1000 hours per year at an electric energy cost of \$0.12 per kilowatt-hour (kW-h). What is the annual cost of the electric energy it uses? $(72,000 \text{ BTU/h}) \times (1000 \text{ h/year}) \times (\$0.12/\text{kW-h}) \div (10 \text{ BTU/W-h}) \div (1000 \text{ W/kW}) = \$860/\text{year}$

General pricing:

New cut (no existing unit) - including air ducts and HERS test, NOT including permit (ask the sub)

3 Ton - \$9500, 4 Ton - \$10,500, 5 Ton - \$12,000

Replacement -

3 Ton - \$8500 , 4 Ton - \$9000, 5 Ton - \$10,000

Mini split - (including electric work)

1 unit - \$3,200 (12000 BTU), \$3,600 (18000 BTU)

2 units - \$6000

3 units - \$9000

4 units - \$11,000

Company presentation :

Step 1 – Permission & Personal Opener

“We’ve got about 15–20 minutes until I hear back about your rebate, so I’d like to talk to you about something a little personal. Is that okay?” **(yes #1)**

“When I first started years ago, I was speaking with my father , and he advised me that the best way to learn the business after the school its in the field , just to take every project - no matter where it is - far / close , small / big , project that i like or no - just to take everything . than i found my self dealing with too many clients and also clients that i honestly dont really like . (they will have shock face) and when i say i dont really like i really mean it - and the reason of that is because they was calling me at 11 pm when was at dinner with my wife , impatient and thinking that construction taking 1 day , screaming me over the phone and than i understand than its not worth it . It wasn’t fun anymore.

And I’ll be honest with you... I feel like we’re already friends. I’ve been here for three hours, and I can’t remember the last time I stayed this long in a home.

so than , because my work is my life from 8-8 its bring me to a situation i want to enjoy with my clients , as my friends . and not to anser because i need to - because i want to!

Step 2 – Relating & Discovery

“What do you do for a living? What time do you finish work? What would happen if someone called you at 11 pm?” *(Pause for answer.)*

“See, for me, I have no choice — I have to answer my customers because they give me their trust and their money. But I want to work with people where the relationship feels good both ways.”

Step 3 – The Key Question

“So let me ask you — when you want to work with someone new at your house what are the most important things you look for?”

(They’ll list items — you guide them.)

- **Price** – “Yes, price is important.”
 - **Experience** – “Right, and you mean experience because it means the company will still be here to honor the warranty, right?”
 - **Warranty** – “You just mentioned that.”
 - **Quality** – “Would you let someone do a low-quality job in the home you’ve lived in for 18 years?”
 - **Honesty** – “Would you hire someone who lies to you? Say the city inspector requires flashing metal and the contractor says he doesn’t have it?”
 - **Trust** – “If I said I’d do the job for \$5,000 but you thought I was a crook, would you give me the job?”
 - **Timeline** – “Finishing on schedule matters, right?”
 - **License/Insurance/Bond** – “You’d want a licensed and insured contractor, right?”
-

Step 4 – Adding Your 2 Values

“Okay, Mr. ____, we’ve got 9 factors we agree on, but you didn’t mention the 2 most important to me “can i say them ? get yes) — **communication** and **respect**.

Communication is the key — you can’t have a good relationship without it.

Respect - where I’m from, that’s everything. All this paperwork? To me, it’s just paper. If I give you my word, shake your hand, and look you in the eye, that’s more important than anything written down.”

Step 5 – Communication Example

“Here’s what I mean by communication — say one of my workers is eating Cheetos in your home and you hate the smell, or your dog is allergic. I have 72 jobs going at the same time — I can’t see everything. So if you don’t call me right away to tell me, how can I fix it? Without communication, problems are guaranteed. Call me any time, any day, but if you don’t call me, I can’t help you.”

Step 6 – Rapid-Fire Agreement (Yes Ladder)

“15–16 years’ experience — is that enough for you?” **(yes)**

“Lifetime warranty — that’s the maximum — good for you?” **(yes)**

“State of California-approved materials — you’ll get a quality job?” **(yes)**

“Have I lied to you today?” **(no)**

“So you feel you can trust me to be a good project manager for you?” **(yes)**

“One-day install, one-day inspection — sound good?” **(yes)**

“\$5 million insurance — enough to rebuild your whole house — enough for you?” **(yes)**

“Communication — can we agree to always be upfront with each other?” **(yes)**

Step 7 – Price Anchor & Close

“Let’s be honest — I’m not the cheapest. Maybe someone else comes in 20% lower. But you’re financing, so that’s maybe \$10–15 a month difference. For everything we’ve talked about — the warranty, the quality, the trust, the communication, the respect — do you think I’m worth \$15 a month?” **(yes)**

- csib story
- laura smith story
- united states triangle story
- v10 story
- my neighbor window story
- BBB , Yelp , Google
- videos testimonials

Price- compared to car shopping. Impossible to compare prices unless all the factors are equal.

- Must compare apples to apples not apples to oranges.

A good and company presentation is one of the most important keys to a sale.

- “Trust but verify”

- B general license – we do it all. Other companies sub the job out which results in higher cost and liability issues. Would you take a chance?

- We have strong a financial backup. We do over 200 jobs a month between residential and commercial.
- Show you are better.
- Get as many "YES" answers for verification.
- Show competition on CSLB through the search option – look for EXPIRED/CANCELLED/SUSPENDED licenses.

Closing:

- Before you move on to the price, ask:
 - Do you like the product? Yes
 - Do you like the company and see why we are the best? YES
 - Do you trust me to do a good job for you? Yes
 - If i give you all of the above with a good price, will you agree it's a good package? Yes
- Your goal is to cover all possible objections and issues before you give a price and have only the price as the sole objection on the table.

- Present the price:
 - “We are going to paint the house” (add job description)
 - The total investment is - \$\$\$
 - The project will take approx. 4-5 week.
 - the total is 30,000\$, from there i need 1k down payment , than the rest will be 29K , and in monthly payment it will be 450\$ for 7 years ? (Assume the sale)
- Always start with a 7 yrs term at a high interest rate. You can always give the customer a deal by extending the term (to 10/15/20 years), lowering the interest rate, adding another product, giving a discount, etc.
- If cash, wait for the customer to respond and based on that you can offer a Same as Cash option for 6 months and then go up to the 12- or 18-month option.
- always discount with a story - to make it looks real
- options for discounts:

Handling typical objections:

1 "I Need to Think About It"

Step 1 – Open the Door

"Sure, I understand. What are your thoughts?" (*Pause — let them talk*)

Step 2 – Get 4 Quick "Yes" Answers

"Do you want to do the project?" (**yes**)

"Do you like what I showed you about the company?" (**yes**)

"Do you trust me to do a good job for you?" (**yes**)

"So, based on what you've told me, your only concern is the price, right?" (**yes**)

Now you've **isolated price as the only objection** — and can focus on handling that.

2 Create Urgency

"Here's the thing — I normally don't even present to residential customers. You're actually getting me here today because of a special push we're doing. Plus, store credits and factory rebates are expiring soon, and I just got a call that we have some warehouse/commercial pricing I can use on your project — but it's only available right now."

(*Tie back to their pain and ask for the sale again.*)

3 Reasons for a Discount (*use only when needed*)

- **Promotion code** – "This code gives you an immediate \$____ off."

Marketing offer – "We can take before/after pictures, do a short video testimonial, put up a yard sign, and make your home our model project — that way, I can give you a better price."

- **Warehouse/commercial deal** – "We have leftover inventory from a commercial job that I can apply to yours for a discount."

Referrals – "If you give me two neighbors or friends I can talk to, I can reduce your price."

4 Other Common Objections & Responses

“I need to talk to my spouse/partner.”

“I understand — but just so we’re on the same page, do you think this is the right project for your home?” (yes) “Do you like the company and trust me?” (yes) “So is it just making sure they feel the same way?” (yes) — Then offer to call them now or schedule a time with both.

“I need to get more estimates.”

“Fair enough. Just so I understand, if you find the same quality, warranty, and trust we’ve talked about for less, you’d go with it?” (yes) — Then explain why competitors can’t match the value without cutting quality or service.

“I’m moving in a few years.”

“That’s actually perfect timing — upgrades now can help you sell faster and for more. Plus, you get to enjoy the benefits while you’re still here.”

“I need to check my finances.”

“No problem — just so I understand, it’s not that you don’t want to do it, it’s just confirming the numbers, right?” (yes) — Then offer payment options or financing.

5 Golden Rule

A “no” now **doesn’t mean no forever** — but the **only chance** to secure rebates, promotions, and special pricing is **now**.

Keep them engaged, isolate the real objection, answer it, and ask for the sale again.

Financing steps :

1. fill the credit application doc
2. send it in your docs whatsapp group with his id

3. fill the template with : company name , amount , terms , and personal info like SSN, Email , phone numbers
4. after approval - high five the client and tell him congratulation
5. sign the loan docs
6. prepare the scope of work (use CHATGPT)
7. send to the client and sign
8. welcome call
9. order material
10. waiver cancellation
11. cool down

Cool Down & Lock the Sale

1 Transition to Cool Down

“Before we wrap up the paperwork, there’s something I like to do with all my customers — it’s kind of a mini survey. Why did you decide to do the project with me today?”

(Let them answer in their own words — listen carefully. This helps lock in their own reasons f

3 Manage Expectations

“This is construction — mistakes can happen, things can take time. I want you to judge me at the end of the project, not in the middle. My promise is that I’ll handle everything for you.”

4 Build Personal Connection After the Close

- Spend another 10-15 minutes talking about life, family, hobbies — anything non-business.

Reinforce the relationship so they see you as both their contractor and their friend.

- don’t rush to go home! this 10 minutes can save you cancellation, you drove already , spent 2-3 hours , don't cut corners at the end !
-

Starting the Job

Goal: Start work tomorrow if possible.

If you can't start right away (rain, HOA approval, waiting for windows, etc.), find something else to start immediately from the lead:

- Automatic gas shut-off valve
- Carbon monoxide detector
- Smoke detector
- Motion sensor lights
- Recessed lighting
- Garage door upgrades
- Interior paint touch-ups
- insulation
- ring camera installation
- amazon gift

come by next day morning , bring some coffee , wear a smile and bring an upsell (:

The idea is to get your team working on-site immediately so the customer feels progress and the project feels real from day one.
